DETAILED ACTION

Claim Rejections - 35 USC § 101

1. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 8-14 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. The cited claims detail an apparatus having a plurality of means. However, as outlined in the specification, the apparatus **can** be implemented in software or **can** be implemented in a computer program product tangibly embodied in a machine-readable storage device (pg. 32, lines 19-24). There is no requirement that the apparatus is computer hardware or is embodied in a machine-readable storage device. Therefore, at best the apparatus is software and do not fit one of the statutory category of inventions. To be a machine, there must be some physical component. The software system does not require it to be stored on a computer storage device that is also required as outlined in M.P.E.P. 2106.

Allowable Subject Matter

2. Claims 1-7 and 15-21 are allowed.

Art Unit: 2195

3. The following is a statement of reasons for the indication of allowable subject matter: The cited claims detail the steps of **serially** receiving a plurality of forward messages from a source, storing the forward messages before attempting to send them to their destinations, receiving an availability signal indicating whether the destination is available, **simultaneously** sending the forward messages to their destinations when an availability signal indicates that the destination is available, **simultaneously** receiving a plurality of reverse messages from the first destinations ; and **serially** sending the reverse messages to the source. The cited prior art of record at best teaches performing transactions / operations on destination memory devices in parallel (wherein the memory commands / requests are combined into one command and sent to the device or parallel processing memory commands on a plurality of memory devices by a memory controller after receiving them serially). The cited prior art of record does not teach the simultaneously sending of stored forward messages after receiving an availability signal indicating that the destination is available and simultaneously receiving a plurality of reverse messages wherein such messages are serially sent to the source. Therefore, the claims are allowable over the cited prior art of record.
